

Container Runtime Engine

In Kubernetes

[▶ Documentation](#)[▼ Getting started](#)[Learning environment](#)[▼ Production environment](#)**Container Runtimes**[▶ Installing Kubernetes with
deployment tools](#)[Turnkey Cloud Solutions](#)[▶ Best practices](#)[▶ Concepts](#)[▶ Tasks](#)[▶ Tutorials](#)[▶ Reference](#)[▶ Contribute](#)[Kubernetes Documentation](#) / [Getting started](#) / [Production environment](#) / [Container Runtimes](#)

Container Runtimes

Note: Dockershim has been removed from the Kubernetes project as of release 1.24. Read the [Dockershim Removal FAQ](#) for further details.

You need to install a container runtime into each node in the cluster so that Pods can run there. This page outlines what is involved and describes related tasks for setting up nodes.

Kubernetes 1.29 requires that you use a runtime that conforms with the [Container Runtime Interface \(CRI\)](#).

See [CRI version support](#) for more information.

This page provides an outline of how to use several common container runtimes with Kubernetes.

- [containerd](#)
- [CRI-O](#)
- [Docker Engine](#)
- [Mirantis Container Runtime](#)

Note:

Kubernetes releases before v1.24 included a direct integration with Docker Engine, using a component named *dockershim*. That special direct integration is no longer part of Kubernetes (this removal was [announced](#) as part of the v1.20 release). You can read [Check whether Dockershim removal affects you](#) to understand how this removal might affect you. To learn about migrating from using dockershim, see [Migrating from dockershim](#).
